INTERACTS WITH SECA AND SECE TO ALLOW THE TRANSLOCATION OF PROTEINS ACROSS THE PLASMA MEMBRANE, BY FORMIGE PART OF A CHANNEL.

-i- SUBUNIT: ONE OF SEVEN SECRETORY PROTEINS (SECA-F & SECY) THAT COMPRISE THE PROKARYOTIC PROTEIN TRANSLOCATION APPARATUS.

-i- SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN.

-i- SIMILARITY: BELONGS TO THE SECY/SEC61-ALPHA FAMILY.

* NOTE: This is a 'working draft' sequence. It currently

* consists of 89 contigs. The true order of the pleces

* is not known and their order in this sequence record is

* arbitrary. Gaps between the contigs are represented as

* runs of N, but the exact sizes of the gaps are unknown.

* This record will be updated with the finished sequence

* as soon as it is available and the accession number will
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1220 bp in length

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The more significant matches with motifs in the PROSITE database are also included but some of these may be fortuitous. The length in codons is given for each CDS.

Usually the highest scoring match found by fasta -o is given for CDS which show significant similarity to other CDS in the database. The position of possible ribosome binding site sequences are given where these have been used to deduce the initiation codon. All CDS over 100 codons have been analysed. Gene prediction is based on positional base preference in codons sepecially where there is an increase in the observed/expected third position G + C. CAUTION: We may not have predicted the correct initiation codon. Where possible we choose an initiation codon (atg, gtg, or ttg) which is preceded by an upstream ribosome binding site sequence (optimally we choose the most upstream initiation codon). If this cannot be identified we choose the most upstream initiation codon.

IMPORTANT: This sequence MAY NOT be the entire insert of the sequenced clone. It may be shorter because we only sequence overlapping sections once, or longer, because we arrange for a small overlap between neighbouring submissions.
                                                                                                                                                                                                                                  Eiglmeier,K., Honore,N., Woods,S.A., Caudron,B. and Cole,S.T.
Use of an ordered cosmid library to deduce the genomic organization
of Mycobacterium leprae

Defails of M. tuberculosis sequencing at the Sanger Centre are available on the World Wide Web.

(URL, http://www.sanger.ac.uk/Projects/M_tuberculosis/) CDS have been renumbered from the original cosmid submissions but the old gene designations are in brackets after the new gene numbers. Gene prediction was based on a Hidden Markov Model of TB genes implemented in TBparse (Krogh) supplemented with visual inspection of positional base preference in codons, especially where there is an increase in the observed/expected third position G + C.

CAUTION: In some cases we may not have predicted the correct intitation codon. Where possible we choose an initiation codon (atg, gt, or ttg) which is preceded by an upstream ribosome binding site sequence (optimally 5-13bp before the initiation codon). If this cannot be identified we choose the most upstream
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /product="hypothetical protein Rv2680"

Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Center code: WIBR

(URL, http://www.sanger.ac.uk/Projects/M_tuberculosis/) CDS have been renumbered from the original cosmid submissions but the old gene designations are in brackets after the new gene numbers. Gene prediction was based on a Hidden Markov Model of TB genes implemented in TBparse (Krogh) supplemented with visual inspection of positional base preference in codons, especially where there is an increase in the observed(expected third position G + C. CAUTION: In some cases we may not have predicted the correct initiation codon. Where possible we choose an initiation codon (atg, gt, or ttg) which is preceded by an upstream ribosome binding site sequence (optimally 5-13bp before the initiation codon. If this cannot be identified we choose the most upstream
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 tuberculosis sequencing and mapping teams, Sanger Centre, Wellcome Trust Genome Campus, Hinxton, Cambridge Ealt 15A Unite de Genetique Moleculaire Bacterienne, Institut Pasteur, 28 rue du Docteur Roux, 75724 Paris Cedex 15, France E-mail: parkhill@sanger.ac.uk

                                                          Direct Submission

Submitted (28-APR-1999) Drosophila Genome Center, Lawrence Berkeley

Laboratory, MS 64-121, Berkeley, CA 94720, USA

Laboratory, MS 64-121, Berkeley, CA 94720, USA

On Aug 2, 1999 this sequence version replaced gi:5629944.

For further information about this sequence, Including its location
and relationship to other sequences, please visit our sequence
archive Web site (http://www.fruitfly.org/sequence/) or send email
to bdgggefruitfly.berkeley.edu. All contigs in this submission meet
the following cutoffs: length >= 200 bases.

* NOTE: This is a 'working draft' sequence. It currently
* consists of 94 contigs. The true order of the pieces

* is not known and their order in this sequence record is

* arbitrary. Gaps between the contigs are represented as

* This record will be updated with the finished sequence

* as soon as it is available and the accession number will

* be preserved.

A computer readable medium has been developed which has recorded on it
982 nucleotide sequences isolated from the Enterococcus faecalis genome.
712938 to X13919 represent these nucleotide sequences which are primary
nucleotide sequences, also known as contigs. The computer-based system
can identify fragments of the Enterococcus faecalis genome with
commercial importance. The products can be used to detect the presence
of Enterococcus faecalis in samples. They can also be used for
diagnosing Enterococcal infection in an animal and monitoring
progression of disease, and for identifying agents which can be used to
modulate the growth or pathogenicity of Enterococcus faecalis, or
another related organism, in vivo or in vitro. In particular the
can be used in vaccines to prevent or attenuate an Enterococcal
                                                                                                                                                                                                                                                                                                  Entercoccus faecalis; contig; SEQ ID NO:420.

A gene cassette is prepd. by division of the OR membrane protein encoding helix structure polypeptides. Restriction sites are indicated. A base sequence contg. such a sequence downstream to the tryptophan regulating gene darived from the E. coli tryptophan operon, the trpic or the trpE polypeptide translation regulating base sequence, and the N-terminal Met of the trpic (or trpE) or trpE polypeptide, respectively, is introduced in an expression vector for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Bacterial antibiotic resitance gene, aacC2, probe.

Well of for the detection of bacterial species using probes and primers - allows detection and quantification of antibiotic cesistant bacteria in patients, the environment and food claim 82; Page 142-143; 216pp; Bnglish.

The sequences given in 728660-76 represent fragments derived from bacterial antibiotic resistance genes which were used as probes in the method of the invention comprises using probes and/or amplification primers which are specific, ubiquitous and sensitive for amplification primers which are specific, ubiquitous and sensitive for determining the presence and/or amount of nucleic acid comprises a selected target region hybridisable with the probes or primers and detecting the presence and/or amount of the bacterial species.

Comprises a selected target region hybridisable with the probes or primers and detecting the presence and/or amount of the bacterial species.

Comprises a selected bacterial species. This method may be used to detect commonly encountered bacterial pathogens, e.g. Escherichials oll, and/or amount of the bacterial species. This method may be used to streptococcus pneumoniae, Staphylococcus aureus, Staphylococcus sprophylicus, Streptococcus sprogenes, Haemophilus influenzae and Moraxalla catarrhalis. Streptococcus pyogenes, Haemophilus influenzae and Moraxalla catarrhalis. These bacterial species are associated with approx. 90% of urinary tract infections and with a high percentage of other severe infections. The analytic method may also be used to evaluate a bacterial resistance to beta-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       174 T;

A single-stranded DNA (or its complementary strand or the corresp.

double-stranded DNA) which comprises one of the 7837 "GS" sequences
given in T19001-T56837 and which is able to hybridise to part of
human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)
sequences were obtained from 3'-directed cDNA libraries prepared
from various human tissues; synthesis of cDNA was initiated from the
3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-
untranslated sequence; sunique to a particular mRNA species, almost
all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library
is constructed so as to reflect accurately the relative abundance of
different mRNAs in the particular tissue from which it was derived.
The appearance frequency of a given GS in a cDNA library can be
determined (esp. using primers and probes derived from the GS
sequences) as a means of diagnosing abnormal cell function or for
recognising different cell types.
                                                                                                                                                Disclosure; Fig 9; 66pp; English.

The gene product may be expressed by an E.coli host transformed with a plasmid encoding the phospholipase gene esp. under control of a Serratia regulatory sequence. The phospholipase product may be used to hydrolyse fatty acids from phospholipids and lipids. Sequence 1400 BP; 283 A; 420 C; 453 G; 244 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Identifying gene signatures in 3'-directed human cDNA library - e.g. for diagnosis of abnormal cell function, by preparing cDNA that reflects relative abundance of corresp. mRNA in specific human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gene signature; messenger RNA; mRNA; relative abundance; frequency; human; cloning; mapping; non-biased library; diagnosis; detection; cell typing; abnormal cell function; ss. New DNA contg. plant systemic acquired resistance genes - and transgenic plants contg. them, impart disease and pest resistance, a lso Arabidopsis gene promoter to control DNA transcription claim 21: Page 70: 85pp; English.

Claim 21: Page 70: 85pp; English.

Claim 21: Page 70: 85pp; English.

Chis sequence represents the DNA sequence of a maize PR-1 like gene, and sequence was isolated by screening a Bri-induced cDNA clibrary of maize. This sequence, Q99800-Q99803 and Q99805 are claimaged in recombinant/chimaeric DNA molecules of the invention. These sequences were isolated by differential screening of a cDNA library, consequences were isolated by differential screening of a cDNA library, consequences were isolated by differential screening of a cDNA library, consequence of cyclohexamide. The genes are used in the creation of transgenic plants. All of these sequences confer anti-pathogenic corporaties to transgenic plants. Transgenic expression of 2 or more of the recombinant molecules of the invention that encode anti-pathogenic corporations provides a synergistic increase in plant protection, and may calso offer protection against a wider range of pathogens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      PR-1 like gene PR-1mz.
SAR; tobacco; protein-synthesis independent gene; cyclohexamide;

                                                                                                                                                                                                                                                                                                                                                                                                                         3401. The genes were designated lipD (Q44280) and limD (Q44281) and they code for a lipses and a lipses modulator protein, respectively. Due to the extreme GC content of the DNA, the sequence was difficult to determine (hence the "others" in the sequence). The limD start codon is positioned 3 bp downstream of the lipD stop codon. LipD and LimD were found to be homologous to LipA and LimA, respectively. In denaturation/renaturation experiments, LimA chaperone protein was
                                                                                                                                                                                                                                                                                                                                                              Prepn. of active lipase in high quantities - by subjecting to denaturation and restructuring in presence of chaperone molecule Example 10; Page 43; 78pp; English.
